LET'S GO!

LEATHERBACK SEA TURTLE

Leatherback seaturtles are one of the most endangered marine animals globally. It is often poached and often hunted because of its hell's pattern. It lives almost on the surface of the ocean, where most of the trash is. Turtles rely on jellyfish for food, so trash like plastic bags are digested causing health issues in their bodies.

 BACK

HOW TO PLAY

1

You play as a fish, swimming in a stream. Trash and food come your way. Touching trash lowers your health, while claiming food keeps you healthy. The goal is to collect food and avoid trash.

2

At the start of the game, you have 3 health hearts. Each time you touch trash, you lose one heart. You need to fill up your stomach with enough food while avoiding the trash. If you gather enough food and survive, you win!

REAL-LIFE STATISTICS

FISH SAVED:

3

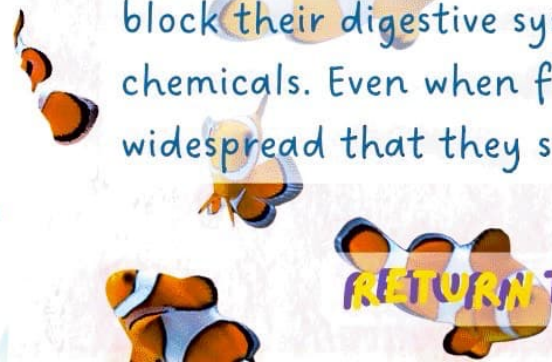

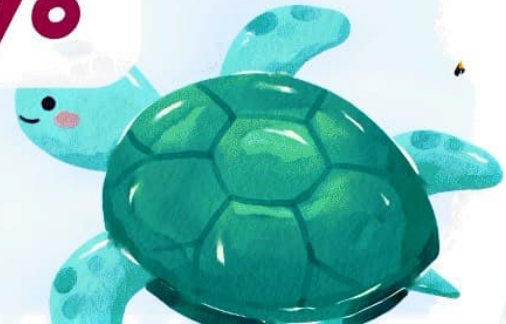

What is it like in real life?

Fish in the ocean often mistake plastic and trash for food, such as jellyfish or plankton. Eating trash can block their digestive system and expose them to toxic chemicals. Even when fish try to avoid it, trash is so widespread that they still end up eating it.

What can i do

RECYCLE

Recycling reduces plastic waste, keeping it out of oceans where marine animals might ingest or get entangled. It lowers pollution, creating a cleaner, safer habitat for sea creatures. This helps protect marine species and ensures healthier ecosystems for them.

LIVE STATISTICS

GREAT PACIFIC OCEAN DUMP

There are about 5 ocean dumps around the world, where all our personal wastes are taken when not recycled. Millions of animals are killed every year and thousands of species are endangered. Only about 3% of our trash is recycled and the rest is littered.
